# GRAPHS

Graphs are represented as a set of vertices and a set of edges.

Sometimes they concretely model a network (roads, communication) but usually they represent abstract relationships (people/friendships or documents/similarity)

Assignment Project Exam Help

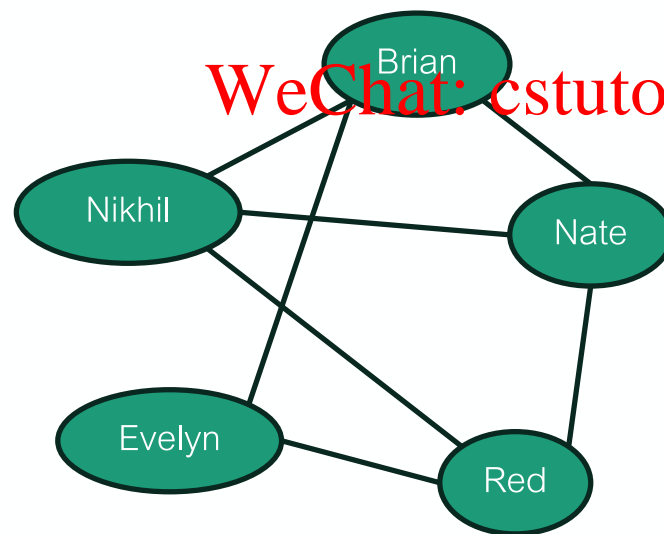

# GRAPHS

- Graphs model relationships.
- We often model problems as graphs and then design algorithms leveraging theory about graphs.
- Examples:
  - Friend Networks
  - Links on the web

# EXAMPLE

Assignment Project Exam Help

<https://tutorcs.com>

WeChat: cstutorcs

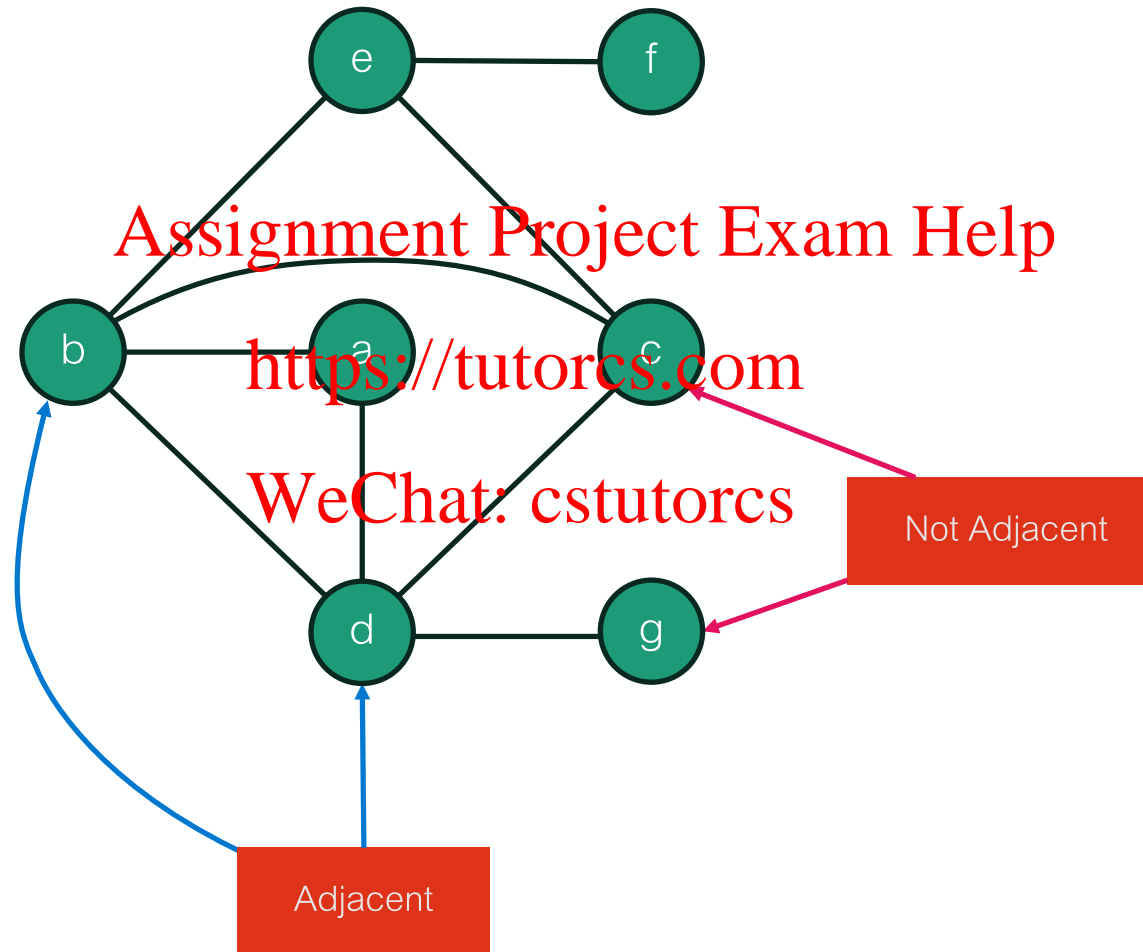

Graph  $G = (V, E)$

$V = \{1, 2, 3, 4, 5\}$  (finite set of vertices)

$E = \{(1, 2), (1, 3), (1, 4), (2, 4), (3, 5), (4, 5)\}$  (finite set of edges)

In general,  $V$  is a set and  $E$  is a set of pairs from  $V$

# GRAPH TERMINOLOGY

# GRAPH TERMINOLOGY

$\text{degree}(b) = 4$

$\text{degree}(f) = 1$

$b, a, d, b, e$  is an example of a path

# GRAPH TERMINOLOGY

$\text{degree}(f) = 1$

$\text{degree}(b) = 4$

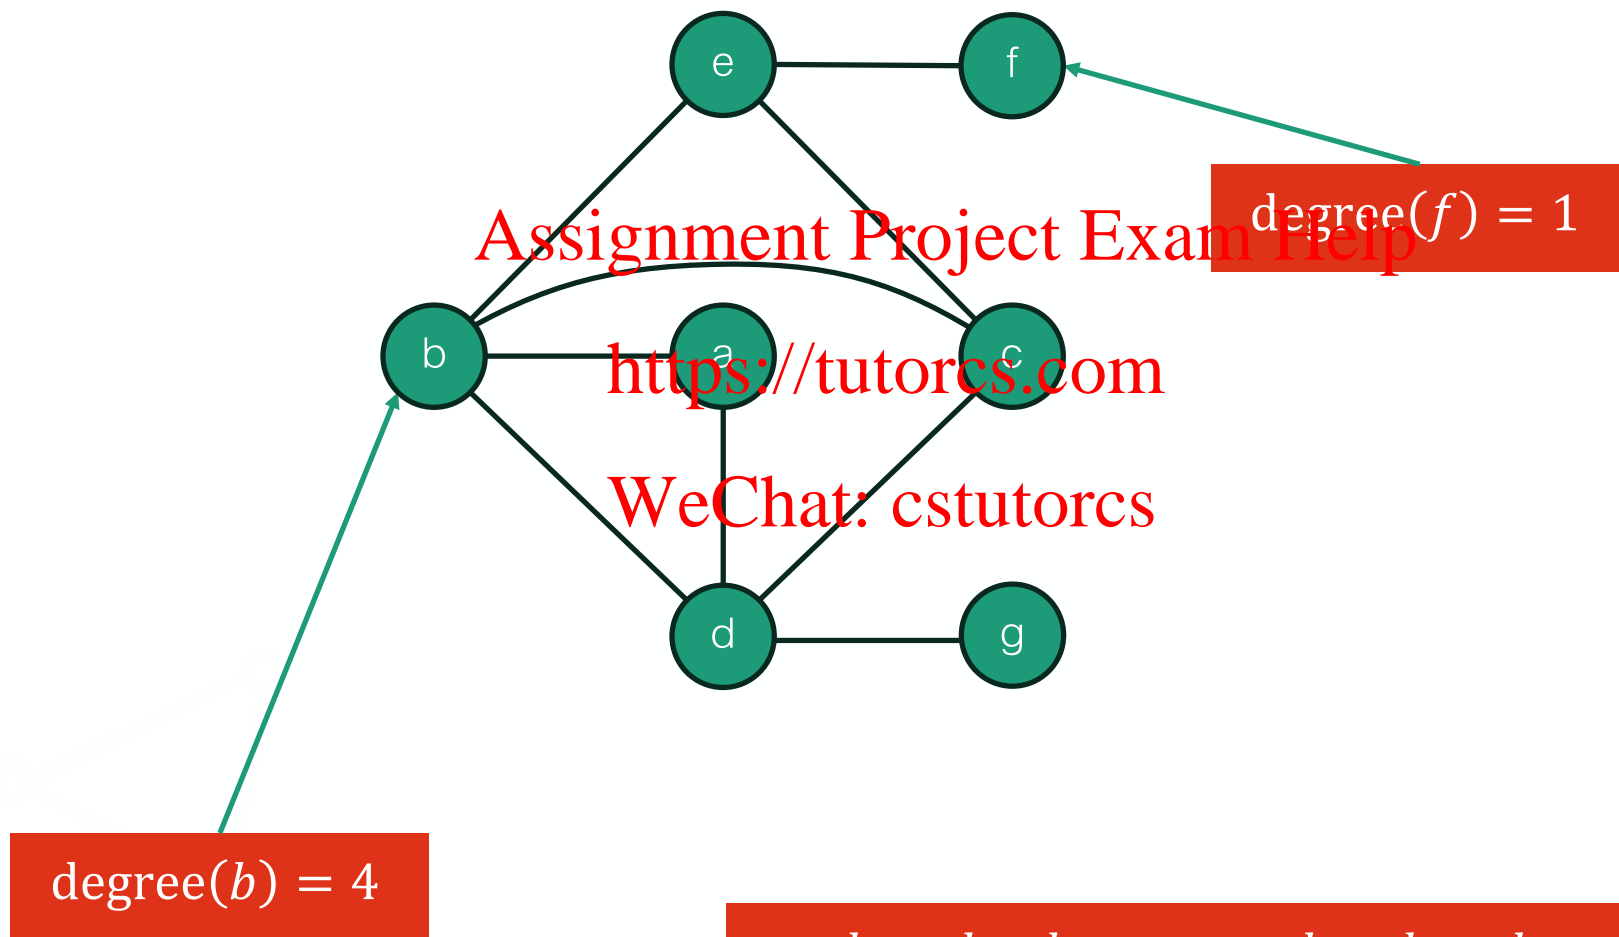

$b, a, d, c$  is an example of a simple path of length 3

# GRAPH TERMINOLOGY

$b, a, d, c, b$  is a cycle but  $b, a, b$  and  $b, a, d, b, e$  are not cycles

# CONNECTED

- Two vertices are connected if there is a (simple) path between them.
- Being connected is an equivalence relation (recall from CIT 592):

- Reflexive: Every vertex has a path of length 0 to itself.

- Symmetric: If there is a path from  $u$  to  $v$  then reverse it to get a path from  $v$  to  $u$  (only works in undirected graphs)

- Transitive: If there is a path from  $u$  to  $v$  and a path from  $v$  to  $w$  then the paths can be concatenated to make a path from  $u$  to  $w$ . If this path is not simple, we can remove cycles to make it simple.

# GRAPHS: CONNECTED, ACYCLIC

- Connected components of a graph: equivalence classes of the “connected” relation
- If only one equivalence class, the graph is connected.
- A graph is acyclic if it has no cycles.
- A connected, acyclic graph is called a tree.

Examples:

a) Connected graph

b) Acyclic graph with 2 components

c) Tree

# NUMBER OF VERTICES AND EDGES

- Convention: Use  $n$  to denote the number of vertices and  $m$  to denote the number of edges in a graph.

WeChat: cstutorcs

$m$  can be as low as 0 or as high as  $\binom{n}{2}$
